THE NEW STANDARD IN LOCKS

FROM MAY 2004 ONWARDS!

Security:

The new locks are all certified according to the current EN standards DIN EN 179 and DIN EN 1125.

Thanks to their mechanical locking mechanism and extensive status messages, they provide increased protection against intrusion.

Comfortable:

The adjustability of the locks simplifies their use as the required versions can be easily converted from the standard version of the corresponding type of lock.

Design:

A large selection of fittings are available for the lock product line.

SECURE

THE NEW effeff LOCK PRODUCT LINE

Both DIN EN 179 and DIN EN 1125 with just one lock model

All new locks conform to both DIN EN 179 and DIN EN 1125 which means that effeff offers a lock that combines both standards in one model. Therefore the user does not have to decide in advance whether the door is to be used as an emergency or panic exit because the lock has been tested and approved for both possibilities.

More security

The outstanding feature of the lock product line is its increased safeguarding against intrusion as per the latest SKG, DIN and EN regulations. They offer resistance against pressure of 10.000 N at the side and the bolt has undergone additional hardening in accordance with the security standard SKG of the Netherlands.

The electromechanical lock products with their extensive status messages convince every customer that the contacts monitor the following:

- Bolt thrown / bolt withdrawn
- Control latch
- Door handle actuation
- Tamper loop
- Cylinder contact

Reassuring Secure

Certified according
to DIN EN.

in locks.

FLEXIBLE

Design:

A wide range of armatures

To provide the user with freedom of choice as regards armatures, the locks from IKON, FSB and HEWI are tested and approved according to DIN EN 179.

For backsets from 55 mm upwards (full leaf version), the new locks are equipped with rosette holes for screwing together commercially available rosettes for handle and profile cylinders.

The matching solution for every bolt length

The locks are available in the backset 30, 35, 40, 45 and 55, 60, 65 and thus cover virtually all single leaf door applications.

With the backset 30, effeff stays abreast of the trend towards the increasingly narrower profile frame. The 80 and 100 backset are planned for the end of 2004.

Special: Quicker motor lock

In order to facilitate the opening of doors with motor locks the unlocking time for motor lock models has been reduced considerably to ensure quick and easy opening. The user releases the door for example by the access control and the motor immediately begins to operate. The door opens quickly thus avoiding unnecessary waiting time and strain on the material.

Left or right Lock tight

As narrow style version

As full leaf version

Fully adaptable.

FEWER OPTIONS

THE LATEST STANDARD IN SECURITY LOCKS

More convenience – fewer options

We combine convenience and efficiency

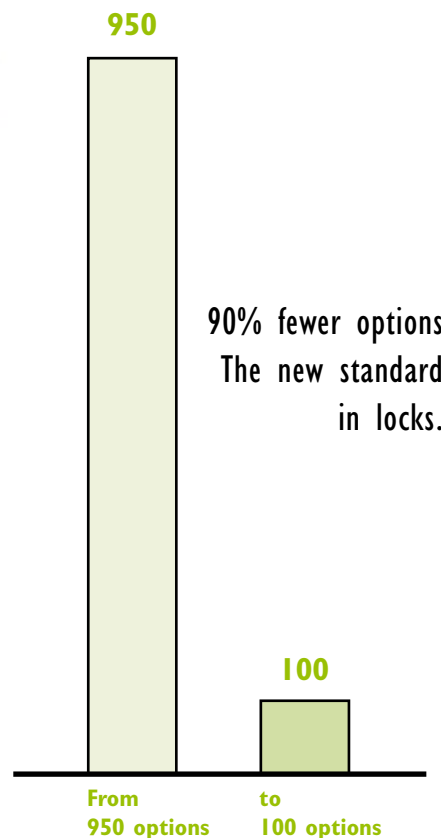

Up to 1000 lock versions have been necessary so far to cope with all the different versions and requirements. With innovative developments and clever ideas the number of DIN lock options has been reduced to 100. This is due primarily to the variation possibilities of the locks,

e.g. left/right and direction of the panic side (inwards/ outwards), and conversion from fail-secure to fail-safe. Also, all locks are designed for 12 to 24 V DC meaning the installer does not have to decide in advance which voltage is required to operate the lock.

All you need to know when ordering the lock is the type (mechanics, micro switch, solenoid or motor lock) as well as the backset and the face plate width. This means considerably less stock for retailers and simplification of lock tenders.
